PUMPED STORAGE PROJECT NUMBER 1 PEGLEG CANYON QUADRANGLE RESERVOIR SITE NO. 8

This application is for storage of water in an artificial reservoir (forebay) to be constructed as part of an electrical energy pumped storage project. This project consists of a forebay and afterbay that will recycle approximately 2,000 acre feet of water per day. The reservoirs will be connected to quasi-municipal water distribution facilities. The estimated annual evaporation from the forebay and afterbay in this project is less than 800 acre feet. The peak generating capacity of this project is about 300 megawatts. The power plant will be located at a point along a line connecting the forebay and afterbay.

The proposed dam in Section 26 T39N R18E M.D.B.&M. will be approximately I30 feet high and will submerge approximately 110 acres of land lying below an elevation of 6,640 feet mean sea level located within Sections 26 and 27 T39N R18E M.D.B.&M. A saddle dam approximately 30 feet high will be located in Section 27 T39N R18E M.D.B.&M. The average total vertical head of this project is approximately 2,110 feet. The selection of the power plant location, dam location and construction methods will depend upon a detailed site investigation and project optimization.
